

MANGROVE PLANTING

Mangroves are magic. Planting more of them could help restore the health of the planet's lands, seas and climate.

Mangroves also serve to protect marine habitats from harmful nutrients and runoff that can harm seagrass, coral reefs and fisheries. The roots help filter water coming off from the land, including pollutants, heavy metals, pesticides and agricultural runoff, therefore maintaining water quality and clarity. They also control nutrient distribution to seagrass beds and coral reefs. Without natural filters like mangroves, dangerous conditions like red tide and sargassum and algal blooms can proliferate.

On September 16, 2023, The Rotary Club of Central Tandag participated the Areawide Mangrove Planting held at Bislig City.
